

Disclaimer- After many attempts of opening my own gym on my virtual box kali linux machine, I was able to successfully run the program. Unfortunately, I ran into many errors along the way. Though I was able to eventually update, change permissions, update again to get the program to run I lost the password to log in and use the program. I tried various commands to update the password but from my research and trial/error it returned unsuccessful. I did reflect on past successful network assessments on my home network for inspiration of this security compliance policy.

Security Compliance Policy

Objectives

1. The overall goal for this policy is to address the devices and security posture of the current at home network based on previous risk assessments. This policy will outline the standards and procedures that apply to all devices connected to the home network such as computers, printers, routers, and IoT devices including tvs, tablets and mobile devices.
2. Maintain a consistent health posture across all electronic devices connected on the network.
3. Create awareness amongst all users who use and have access to the network of security practices.

Scope

This policy applies to the relevant devices on the Pressley home network including: MSI laptop, the router HP Printer1, HP Printer2, Samsung TV 1, Samsung TV 2, Samsung Tablet 1, the router, and the 5 mobile devices that connect to the network.

Responsibilities

Every user who uses a device on this network is responsible for maintaining security postures and implementing procedures outlined in this policy.

Is it management's responsibility to make sure that the policy remains up to date and performs monthly audits to ensure that all permissions and security standards are being followed.

Compliance

1. Router Security

- a. Ensure default router credentials are changed after installation
- b. Ensure WPA3 encryption is enabled on the network
- c. Ensure updates to the router's firmware is regularly maintenance to patch vulnerabilities
- d. Ensure remote accessibility to the administrative permission is disabled.

2. IoT (Mobile/Printer/TV) Device Security

- a. Ensure that AV and AM software is on each device and updated
- b. Ensure all devices are regularly updated with the latest security patches
- c. Ensure firewalls on all devices are installed and configured to block unauthorized access
- d. Ensure all unused services and unused ports are closed to limit the attack surface.

3. Password/Permission Management

- a. MFA aka Multi-factor authentication needs to be utilized on every login possible
- b. Do monthly password changes and updates that are not similar to previous ones
- c. Store passwords only through a secure/reliable password management system or physical copies
- d. Use unique passwords for each device that are not related to the device (ex: do not use WiFy2024 as your password for the wifi network).
- e. If multiple users have access to the same account on the same network, ensure that permissions are established depending on the user.

4. Network/Data Security

- a. Encryption protocols must be enabled to protect data in transit
- b. Encrypt all sensitive data on devices
- c. Have regular back ups set up monthly
- d. Ensure that the network is set up into segments with various restrictions in order to isolate devices

5. Monitoring & Audits

- a. Regularly monitor the network using tools to detect suspicious activity
- b. Regularly review logs and alerts looking for anomalies
- c. Investigate quickly if there identified security threats or updates
- d. Regularly conduct audits to ensure that each device is meeting the compliance expectations
- e. Identify, log and address any lack of action or straying from security standards

Effective Date

This policy is effective starting April 7th, 2024 and is to be enforced by management.
